CLAIMS:

1. (Previously presented) A liquid crystal display apparatus comprising:

a liquid crystal display panel that receives image data and displays an image according to the image data;

a data printed circuit board that is electrically connected to the liquid crystal display panel to provide the liquid crystal display panel with the image data;

a backlight assembly disposed under the liquid crystal display panel to provide the liquid crystal display panel with a light;

a digitizer; and

a receiving container having a front side and a back side, the front side supporting the backlight assembly, first and second protrusion portions being formed on the back side to support the data printed circuit board, such that the data printed circuit board is spaced apart from the back side of the receiving container to form an insertion space that extends from the first protrusion portion to the second protrusion portion, the insertion space being configured to facilitate insertion of the digitizer between the data printed circuit board and the receiving container.

2. (Previously Presented) The liquid crystal display apparatus of claim 1, wherein the receiving container includes first and second connection portions protruding from end portions of the receiving container, such that a width of the end portion of the receiving container is larger than a width of the receiving container, the first and second protrusion portions protrude from the first and second connection portions respectively, and the first and second protrusion portions include first and second connection holes respectively.

3. (Previously presented) The liquid crystal display apparatus of claim 2, wherein the data printed circuit board includes third and fourth connection portions corresponding to the first and second connection portions of the receiving container, the third and fourth

connection portions have third and fourth connection holes respectively, and the third and fourth connection holes correspond to the first and second connection holes respectively.

4. (Previously presented) The liquid crystal apparatus of claim 3, wherein a first bolt penetrates the first and third connection holes and a second bolt penetrates the second and fourth connection holes, so that the data printed circuit board and the receiving container are combined together, such that the data printed circuit board and the receiving container are spaced apart from each other.

5. cancelled.

6. (Original) The liquid crystal display apparatus of claim 1, wherein the first and second protrusion portions are disposed on the edge portion of the receiving container, and the first and second protrusion portions have first and second connection holes.

7. (Previously presented) The liquid crystal display apparatus of claim 6, wherein the data printed circuit board includes third and fourth connection holes corresponding to the first and second connection holes, respectively.

8. (Previously presented) The liquid crystal display apparatus of claim 7, wherein a first bolt penetrates the first and third connection holes and a second bolt penetrates the second and fourth connection holes to combine the data printed circuit board and the receiving container, such that the data printed circuit board and the receiving container are spaced apart from each other.

9. cancelled

10. (Previously presented) The liquid crystal display apparatus of claim 1, wherein the digitizer is chamfered to be disposed between the data printed circuit board and the receiving container.

11. (Previously presented) A tablet personal computer comprising:

a liquid crystal display panel that receives image data and displays an image according to the image data;

a data printed circuit board that is electrically connected to the liquid crystal display panel to provide the liquid crystal display panel with the image data;

a backlight assembly disposed under the liquid crystal display panel to provide the liquid crystal display panel with a light;

a digitizer;

a receiving container having a front side and a back side, the front side supporting the backlight assembly, first and second protrusion portions being formed on a back side to support the data printed circuit board, such that the data printed circuit board is spaced apart from the back side of the receiving container to form an insertion space that extends from the first protrusion portion to the second protrusion portion, the insertion space being configured to facilitate insertion of the digitizer between the data printed circuit board and the receiving container;

a chassis that receives the liquid crystal display panel and backlight assembly; and

wherein the digitizer provides the data printed circuit board with signals corresponding to coordinate information.

12. (Previously Presented) The tablet personal computer of claim 11, wherein the receiving container includes first and second connection portions protruding from end portions of the receiving container, such that a width of the end portion of the receiving container is larger than a width of the receiving container, the first and second protrusion portions protrude from the first and second connection portions respectively, and the first and second protrusion portions includes first and second connection holes, respectively.

13. (Previously presented) The tablet personal computer of claim 12, wherein the data printed circuit board includes third and fourth connection portions corresponding to the first and second connection portion of the receiving container, the third and fourth

connection portions have third and fourth connection holes respectively, and the third and fourth connection holes correspond to the first and second connection holes respectively.

14. (Previously presented) The tablet personal computer of claim 13, wherein first bolt penetrates the first and third connection holes and second bolt penetrates the second and fourth connection holes, so that the data printed circuit board and receiving container are combined together, such that the data printed circuit board and the receiving container are spaced apart from each other.

15. (Original) The tablet personal computer of claim 11, wherein the first and second protrusion portions are disposed on the edge portion of the receiving container, and the first and second protrusion portions have first and second connection holes.

16. (Previously presented) The tablet personal computer of claim 15, wherein the data printed circuit board includes third and fourth connection holes corresponding to the first and second connection holes respectively.

17. (Previously presented) The tablet personal computer of claim 16, wherein a first bolt penetrates the first and third connection holes and a second bolt penetrates the second and fourth connection holes to combine the data printed circuit board and the receiving container, such that the printed circuit board and the receiving container are spaced apart from each other.

18. (Previously presented) The tablet personal computer of claim 17, wherein the digitizer is chamfered to be disposed between the data printed circuit board and the receiving container.
